

APPIAN FOR SHAREPOINT

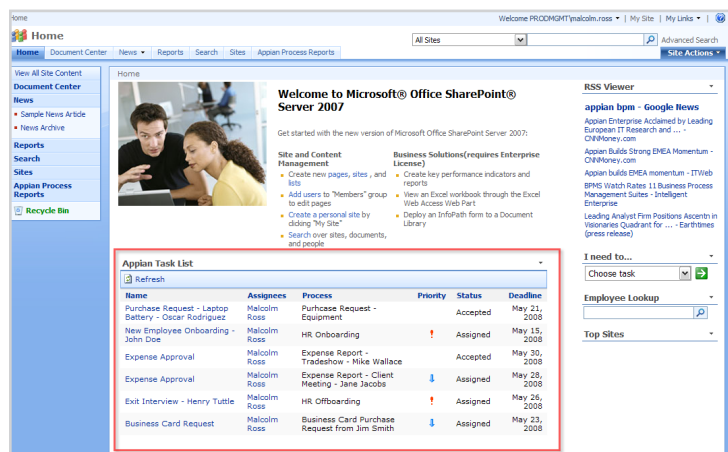

Appian for SharePoint is designed to extend the capabilities of your existing Microsoft Office SharePoint Server 2007 system with the enterprise BPM capabilities offered by Appian.

Appian, the leading Business Process Management Suite, accelerates BPM value through a comprehensive, flexible, and easy-to-use platform for creating automated business processes over the web.

Appian for SharePoint includes:

- Enterprise BPM capabilities integrated with Microsoft SharePoint 2007
- SharePoint WebParts for tracking tasks and process performance
- SharePoint action control for orchestration in Appian
- Single Sign-on between Microsoft SharePoint and Appian

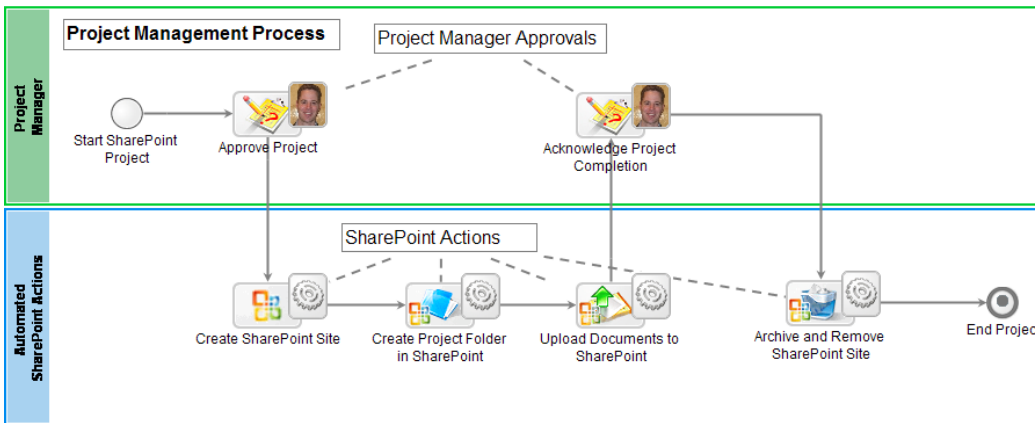

Using Appian for SharePoint, users can easily track process performance, handle tasks, and escalate actions from their Microsoft SharePoint dashboard. In addition, Appian can bring process orchestration to the management of sites, folders, documents and permissions. Appian for SharePoint includes native service interfaces to control common SharePoint actions in a structured process to facilitate the automatic construction and destruction of SharePoint content.

CUSTOMER EXAMPLE

Appian for SharePoint can be easily deployed to solve common process and routing requirements across an organization. As an example, a Microsoft SharePoint user community might use the rich collaboration features of SharePoint to manage key projects for their organization. Each project requires approval before forming, and each project must have its own site, folder area and supporting documents that the project members can access. Project tasks and status must be tracked, and upon completion of the project, all content must be removed and archived from the SharePoint system.

This is a common example that highlights the need to marry the structured process environment of an enterprise BPM system like Appian and the collaborative, ad-hoc nature of a SharePoint site and collaboration area. Simple workflows may be created in SharePoint, but Appian allows for complex orchestration of both system and human events and detailed tracking and Business Activity Monitoring of all actions. Using the Appian for SharePoint module, the project office head is able to quickly create a process to manage the creation of a new project. Approval steps are mapped using the drag-and-drop techniques of the 100% web-based Appian Process Modeler. Once the project is approved, Appian for SharePoint provides automated steps in the process to create the project site, folders, documents and permissions without any manual intervention. As project workers complete key tasks, Appian provides real-time project status reports in the Microsoft SharePoint dashboard. Each report element is drillable to the task or process details for project managers to quickly discover bottlenecks and issues. Upon completion of the project, Appian for SharePoint can automatically archive all project documents and remove the SharePoint site, eliminating any need for manual administration.

Appian for SharePoint is able to deliver quick results with:

- **Easy process mapping** for orchestrating Microsoft SharePoint information
- **Enterprise BPM capabilities** embedded in the Microsoft SharePoint environment
- **Rapid development** of automated processes
- **No coding required** to produce process applications in SharePoint

ABOUT APPIAN

Appian is the global innovator in enterprise and on-demand business process management (BPM). Appian provides the fastest way to deploy robust processes, collapsing time to value for new process initiatives. Businesses and governments worldwide use Appian to accelerate process improvement and drive business performance.
